**Save Water
And Tap Into
A Warm Shower
...every time!
Shoulda used
HotFlush!**

It's easy to do with new **HotFlush**

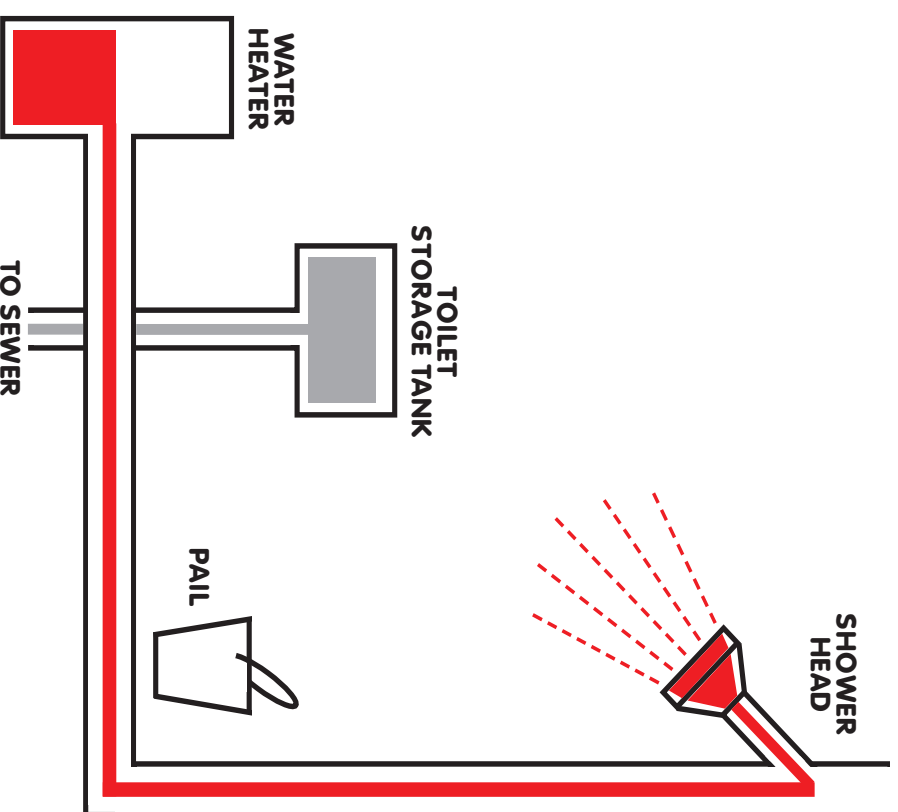

Now anyone can play an important part in the Green Movement by installing HotFlush in their bathrooms where they shower.

Patent pending at the US Patent Office, **HotFlush** will stop each of us from wasting water while we wait for the hot water to come into the showerhead. The water that one would normally allow to go down the drain (while waiting for the hot water to come through the pipes) is the water every one can save every time one uses the toilet before showering.

That same water, thanks to **HotFlush**, can be used or diverted by the device into the toilet tank. Conceptually this is similar to placing a bucket to catch the cold shower water and then pouring it into the toilet storage tank.

Here's how to measure your savings: Place a bucket in the shower and catch the water that is wasted waiting for the hot water to arrive. (This is the volume that **HotFlush** can save every time you use the toilet before showering. Only **HotFlush** can help save what could be hundreds of gallons of water a year. It works in saving precious water and in saving on water bills. What's more **HotFlush** is easy to install and goes to work immediately!

Water is a precious commodity that we all need to conserve. Thinking green when it comes to water, can make all the difference in the world for each and every one of us. Every gallon you save contributes to helping the planet.

Here's how HotFlush works:

Water pipe to the shower with diversion (**HotFlush**) to the toilet storage tank **HotFlush** allows cool water to flow into toilet storage tank.

HotFlush then gets turned off as warm water arrives, allowing one to step into a warm shower.

It's easy and it works like a charm. Say "goodbye" to getting into a freezing cold shower or to wasting that cold shower water needlessly. No more water (and money) down the drain.

Shoulda used HotFlush!
